Back-end Coding Audition

Your project is a easy tweet search app. You'll build a search functionality to perform a search within a set of random tweets given to you. Suggested time spend on the assignment is <8h

Data

Data includes the tweet corpus.

Functionality

Please create a search functionality on top of the collected tweets.

- The app should have a search bar that allows you to search within the selected tweets
- Results should by default be ordered by relevance
- #hashtags and @users should be links to new search actions with these terms as keywords (Clicking #node should start a search for tweets containing #node)

Other Requirements:

- Build your app in node.js. Feel free to use your front end framework of preference to display the results of the app.
- Please email us your un-minified code
- Don't forget to include a README file explaining how to run your app

Engineering

Please impress us with your very best software engineering skills. Besides the functionalities above, your solution should be production-quality in its implementation and overall behavior.

Good luck!
